+ S60 Hacking: Nokia vs. Users - 1:2!

02 June 2008

How To HACK for New Firmware with Anti-Hacking Measures!

In an attempt to prevent one of the **most creative solution** in the hacking/modding scene, Nokia has introduced new firmware versions for most of their S60 powered phones. With the arrival of the newest firmware, Nokia successfully close the latest **ROM Patcher** on all updated S60 Phones.

Disabling the TRK application is actually quite smart move; especially consider that based on **FCA's info that is the only weaknesses** over Symbian 3rd Edition because the core security system has not been broken.

As a reaction, **users have started** to look for the **new solutions** to keep the ability for unlimited access even after the firmware upgrade. Now I am honored to inform you that Nokia's first attempt to find a way to kick

users of the full system access was completely unsuccessful, our mighty **FCA** has finally found a new weaknesses and I'm happy to try to make some easy to follow How To for everyone.

Some FW in this categories are **E90 running FW 210**, **E51 running FW 200** and several **Nokia N95-3** and **Nokia 95-4**. Also this method work for N93 which never before have the luxury of doing HACKING.

However FCA already post his warning that unless you need this method please used the previous method first because its saver and more full proff method.

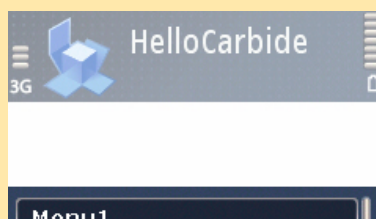

OK to begin you will require a package of this apps. I already package them into one ZIP files, so its much easier. Credit goes to those who create the apps not to me. Off course you will also require **File Manager** of somekind that can view restricted access such as **Y-Browser** and **X-plorer**.

..[FP1 PHONES]:.

..[PRE FP1 PHONES]:.

- Now unzip my package (*you'll see 3 files*) and copy all of it to E:/yourdir
- Install YBrowser (*you dont need to install it if you already have it*)
- Install HelloCarbide.sisx
- Run YBroser and keep it running in the background. This way you will be able to keep it running after S60 crash.
- Run HelloCarbide.sisx and click options >> menu1 >> OK

- After you click OK, Symbian will crash and you wont be able to open any application accept for **Y-Browser**.
- Go to YBrowser and copy installserver.exe from E:/yourdir into C:/sys/bin/

- Now you need to REBOOT your mobile (you need to turn it off and turn it on again)
- After you turn on the phone you will be able to install ROMPatcher_1_0_2_Unofficial_SIS.sisx with all capabilities.
- Now you will be able to run RomPatcher and DisableCaps to again have a full abilities to do a lot of thing you can do with RomPatcher

- Now go back to YBrowser and make sure you delete C:/sys/bin/installserver.exe. Please remember to delete this files, because this files will transform all your application with all capabilities which may cause CHAOS. I rather use the old method of signing rather than used this dangerous method.
- RomPatcher already give you the ability to change SWIPOLICY used this method (saver)
If all when welll your mobile should be running smoothly with HACK + RomPatcher

hacking

Credit goes to everyone who create the program FCA, ZORN, SwankyLeo, SWmail and everyone else who I miss to announce here.

P.S. Use common sense BACKUP before you do this dangerous stunt I did not held any responsibility for anything.

Enjoy!!

Free your mind, break the rules :]
